                            meturic matrix metalloprotocianse 2 (chwwb-2 see Anwilli) it can be produced by recombinant methods such as PCR amplification (see Anvi2501) of chwwh-2 coding sequence (see Anvi2503) and cloning into a post of the compression in E. coll as a fixeion protein with glutchione-g-transferses. The invention relates to the classification in E. coll as a fixeion protein discovery that angiogenesis is mediated by the specific vitronectin comport alpha v beta-3 and that limitation of alpha v beta-3 function inhibits angiogenesis. Claimed antagonists of alpha v beta-3 except conditions angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   smooth muscle cells following angioplasty and to reduce blood supply to selected tissues. The antaquonists particularly inhibit necovascularisation where this is induced by cytokines, e.g. transforming growth factor alpha. epidermal growth factor or especially vascular andotholial growth factor; note: this sequence does not appear in the specification; it was

They can also be used to treat restenoist caused by migration of smooth muscue cells following analopiasty and to reduce blood supply to selected tissues (claimed). The new anagomists are highly selective for ampiogenesis. Only new blood vessels express talpha-y beta-j, so manture vessels are unaffected, and the analogonists alpha-y beta-j, so manture vessels are unaffected, and the analogonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antibody or organic mimetic compound. The antagonists are used to inhibit angiopenesis in inflammed tissue for treatment of arthritis or rheumatoid arthritis; solid cumours or metastases particularly to induce tumour regression or inhibit growth of tumours; and in occitar disorders such as diabetic retinopathy or macular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      should be

Peptides AAW1234-39 are derived from the chicken matrix metalloprotease-2 (MMP-2) protein (AAW1227). The present peptide is derived from amino acids 410-637. The peptides are able to act as alpha-v-beta-5 antagonists. Alpha-v-beta-5 is a virromectin receptor inhibitors of alpha-v-beta-5 can inhibit maylogenesis. The specificate describes a novel labelled package that contains an inhibitor of

an alpha-v-beta-5 antagonising

polypeptide that binds

The antagonists are used to inhibit anylogenesis in inflamed dissue. In solid tumours or metastases, and in a wide range of ocular disorders (e.g. diabetic or other forms of retinopathy, neovascular glaucoma, or corneal transplants). They are particularly used to induce regression or to inhibit growth of tumours. The alpha-v-beta-5 antagonists can also be used to treat restenosis caused by migration of smooth muscle cells following angioplasty and to reduce blood supply to selected tissues. The antagonists particularly inhibit neovascularisation where this is induced by cytokines, e.g. transforming growth factor capible. The sequence does not appear in the specification; it was created using information provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Angiogenesis: inhibitor; antagonist; integrin alpha-v beta-3; virrometin receptor; rheumatoid arthritis; tumour; metastasis; diabetic retinopathy; macular degeneration; restenosis; therapy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ΧX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Or This protein sequence comprises chicken matrix metalloproteinase-2 (CHMMP-2). The invention relates to the discovery that angiogenesis is mediated by the specific vitromecin receptor alpha v beta-3, and that inhibition of alpha v beta-3 function inhibits of alpha v beta-3 function end that inhibition of alpha v beta-3 function inhibits of angiogenesis. Claimed antegonists of alpha v beta-3 includes considering the control of the chmman or chicken kmp-2. An kmp-2 fragment can be obtained by recombinant DNA methods, such as PCR amplification of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region, cloning into e.g. postary of the chmmp-2 coding region and coding reg

```

The present sequence represents the chicken matrix metalloprotease-2 (wMP-2) protein sequence. Fragments of this protein (AAW41234-39) are able to act as alpha-v-beta-5 atagopoists. Alpha-v-beta-5 is a vitronectin receptor. Inhibitors of alpha-v-beta-5 can inhibit

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        moctastases, and in a wide range of ocular disorders (e.g. diabetic or other forms of rethopathy, neovascular glaucoma, or corneal transplants). They are particularly used to induce regression or to inhibit growth of tumours. The alpha-v-beta-5 antagonists can also be used to treat restenosis caused by migration of smooth muscle cells following angioplasty and to reduce blood supply to selected tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             contains an inhibitor of anglogenesis i.e. an alpha-v-beta-5 untagonising polypeptide that binds to integrin alpha-v-beta-5 and includes a part of the C-terminal domain of MMP. The antagonists are used to inhibit anglogenesis in inflamed tissue, in solid tumours or
                             The present invention relates to the coding and protein sequences for i Mostco Maphi restriction endonucleuse and methylase enzymes. Both of those enzymes are components of the bacterial restriction-modification system. They can be used in the laboratory to create recombinant
                                                                                                                                                                                                                                           New recombinant DNA encoding for NapHI restriction endonuclease methylase enzymes useful for creating recombinant molecules and producing these enzymes in large quantities
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US6130078-A

LTR coding sequences may be used in the gene therapy of disorders mediated directly or indirectly by defective or insufficient amounts of any of the LTR polypeptides can be used to treat autoimmune diseases and disease states with suppressed immune function.

                                                                                                                                                                                                                                                                             Host cells transformed with a vector which are capable of expressing a leukocyte immunoglobulin like receptor (IIR), can be used to produce the LIR polypoptide. LIR coding sequences may be used in the gene therapy of disorders mediated directly or the LIR polypoptides can be used to treat autoimmune polypoptides. The LIR polypoptides can be used to treat autoimmune diseases and disease states with suppressed immune function.

```
The present sequence is the chimeric protein comprising, residues 1-246 from the modified aminor-terminal domain of interferon regulatory factor, IRE-7 and 132-427 residues from the carboxy-terminus of modified IRE-3 (5D) protein. The scrime and throntine residues are post-translationally modified By phosphorylation, following sendal virus infection. The modified By substituted with aspartic actid, inections as a strong activator, of promoters containing ISRE and PROI/PROILI caulatory
                                                                                                                                                                                                                                                                                                                                                               elements, stimulation of DNA binding and transcriptional activity and protessome mediated degradation. The modified IRE sequences are used for the treatment of viral infections like, influenza, horpes or HIV infection. They may also be used to activate a cytokine gene, in cancer treatment or to modify a target cell of an organism.
                                                                                                                                                                                                                                                                                                               Sequence

            antiparkinsonian, and immunostimulant. The proteins and polynucleotides encoding them can be used in gene therapy, antisense therapy and vaccine production. The proteins and polynucleotides are useful for screening for agonists or antisponists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, rehumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal intentions, autoimmunity, genetic diseases, hacmatopoletic disorders, intentions, autoimmunity, genetic diseases, hacmatopoletic disorders.
                                                                                                                                                                                            cells they are expressed in, such as antiinflammatory; antirheumatic; antianthritic; immunosuppressive; antiantental; endocrine; cardiant; central nervous system; virucide; anti-HIV; fungicide; antimutegen; cardiovascular; antianaemic; antiagregant; haemostatic; vulnerary; antiulocr; osteopathic dermatological; antiallorgic; antiasthmatic; antidiotric; cytostatic; neuroprotective; antidepressant; nootropic; antidiabetic; cytostatic; neuroprotective; antidepressant; nootropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     dormatiological; antiallergic; antiaslumatic; artidiabetic; gytostatic; neuroprotective; antidepressant; nouropic; antiparkinsonian; infection; neuroprotective; antidepressant; nouropic; antiparkinsonian; inflammation; antianaphylactic; rheumatoid arthritis; septic shock; poncreatitis; cardiac dysfunction; neuropathology; cardiac anaphylatis; autoimmnity; genetic disease; haematopoietic disorder; platelet disorder; asthma; thrombocytopaenia; osteoporosis; severe combined immunodeficiency; allergic rhinitis; diabetes; multiple sclerosis; depression;
                                                                                                                                                                                                                                                                                                                                                                                                    Claim 20; Page 220; 1217pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated human polynucleotides encoding polypeptides, useful for treatment and diagnosis of e.g. cancer, ulcers and {\sf HIV} infection

                                                                  This chimeric sequence is one example of a hybrid Fc receptor of the invention. The hybrid Fc receptor retains the Iq binding functions of the constituent receptor types. It can be used for regulating antibody production in vivo and in plasmaphoresis to
Sequence
                          remove immune complexes or pathological antibodies. Rabbit IgG
bound to cells transfected with the chimeric Fc(gamma) receptor
